

ADVANCES IN TECHNOLOGIES FOR CO₂ CONVERSION TO CHEMICALS

A Techno-economic investigation
commissioned by the members of the
Carbon Dioxide Capture & Conversion (CO₂CC) Program

Client Private
January 2011
(for the 2010 membership year)

The Carbon Dioxide Capture & Conversion (CO₂CC) Program

The **CO₂CC Program** is a membership-directed consortium whose members are involved in the development, monitoring and utilization of the “state-of-the-art” in technological progress and commercial implementation of carbon dioxide capture/clean-up and conversion. By the direction of the member companies (through balloting and other interactive means), the program delivers a range of timely and insightful information and analyses which are accessible exclusively to members and protected by confidentiality agreements. The objective is to document technically and commercially viable options for CO₂ capture/clean-up as well as its conversion into useful products which meaningfully address the challenges posed by CO₂ life-cycle and overall sustainability issues.

Members receive three in-depth **CO₂CC Techno-economic Reports** which are written by leading scientists and experienced industry professionals in areas selected by the membership (via ballot); weekly *CO₂CC Communiqués* (delivered via e-mail) which provide the latest updates on technical breakthroughs, commercial events and exclusive development opportunities; and attendance at the CO₂CC Program **Annual Meeting**.

The **Carbon Dioxide Capture & Conversion (CO₂CC) Program** is available on a membership basis from The Catalyst Group Resources (TCGR). For further details, please contact John J. Murphy at John.J.Murphy@catalystgrp.com or +1.215.628.4447 (x1121).

CONTENTS

EXECUTIVE SUMMARY	xiii
1. INTRODUCTION	1
1.1 SCOPE AND OBJECTIVES OF REPORT	1
1.2 IMPORTANCE OF CO ₂ CONVERSION IN MONETIZING GHG EMISSIONS	3
1.3 ADDRESSING THE ISSUE OF SCALE FOR CO ₂ -DERIVED CHEMICALS	4
1.4 R&D NEEDS FOR CO ₂ -DERIVED CHEMICALS	6
1.5 OPTIONS IN THE VALUATION OF CO ₂	7
1.6 REPORT CONTRIBUTORS	10
1.7 REFERENCES	12
2. CO₂ CONVERSION TO LOWER MOLECULAR WEIGHT ORGANICS AND HYDROCARBONS	15
2.1 STATE OF TECHNOLOGY/COMMERCIALIZATION	15
2.2 REVIEW OF OPTIONS – ACIDS, ALCOHOLS, ALDEHYDES, ETHERS, HYDROCARBONS	18
2.3 TECHNOLOGIES FOR CO ₂ CONVERSION TO CARBOXYLIC ACIDS AND DERIVATIVES	22
2.3.1 Advances in the Conversion of CO ₂ to Formic, Oxalic and Acetic Acid	22
2.3.1.1 Formic acid	22
2.3.1.2 Oxalic acid	27
2.3.1.3 Acetic acid	28
2.3.2 Mantra Venture Group’s Electroreduction of CO ₂ to Formic Acid	30
2.3.3 Advances in the Conversion of CO ₂ and Alkenes to Acrylic Acids and Esters ...	32
2.4 TECHNOLOGIES FOR CO ₂ CONVERSION TO ALCOHOLS, ALDEHYDES, ETHERS, AND HYDROCARBONS	34
2.4.1 Methanol, Ethanol and Dimethylether (DME) Synthesis from CO ₂	34
2.4.1.1 Methanol	34
2.4.1.2 Ethanol	41
2.4.1.3 Dimethylether (DME)	41

2.4.1.4	Mitsui’s catalytic process for producing methanol from CO ₂ based on their “Green House Gases-to-Chemical Resources (GTR)” technology.....	42
2.4.1.5	Carbon Recycling International (CRI) clean renewable methanol – RM	43
2.4.1.6	The CAMERE process (CO ₂ hydrogenation to methanol via a reverse-water gas shift reaction) operated by the Korean Institute of Science & Technology (KIST).....	44
2.4.1.7	Reforming of methane by CO ₂ and steam to produce DME; Mitsubishi and Kansai Electric	47
2.4.2	Conversion of CO ₂ to Higher Alcohols and Hydrocarbons (>C ₂) Using Biocatalysis or Electrocatalysis Methodologies.....	49
2.4.3	Modification of Fischer-Tropsch (FT) Synthesis with CO ₂ -rich Syngas for C ₂ -C ₄ Alkene Formation.....	52
2.4.4	CO ₂ Absorption/Reduction in Catalytic Pores	54
2.5	TECHNO-ECONOMIC ASSESSMENTS	56
2.5.1	Mitsui Chemicals’ Methanol from CO ₂	56
2.5.1.1	Factors that impact economic viability	56
2.5.1.2	Speculative economic assessment	59
2.5.1.3	Economic assessment - conclusions.....	65
2.5.2	CAMERE Methanol from CO ₂	66
2.5.2.1	Factors that impact economic viability	66
2.5.2.2	Speculative economic assessment	68
2.5.2.3	Economic assessment - conclusions.....	73
2.6	LIFE-CYCLE CARBON FOOTPRINTS FOR SELECTED CONVERSION ROUTES	73
2.7	POTENTIAL COMMERCIAL IMPLICATIONS	76
2.8	REMAINING TECHNICAL/ECONOMIC HURDLES	78

Figure 4.1.1.1	Schematic description of photosynthetic conversion of CO ₂ , solar energy, and wastewater into a variety of valuable end products (e.g., bioenergy, food additives, pharmaceuticals, and cosmetics) by using microalgae (Ho <i>et al.</i> , 2010).....	142
Figure 4.1.1.2	Development of low-cost photobioreactors. Flat-panel reactors from (A) Proviron, Belgium, (B) Solix Biofuels, USA, and (C) Fotosintetica & Microbiologica S.r.l., Italy (Wijffels and Barbosa, 2010).....	144
Figure 4.1.2.1	An overview of photosynthesis: photosynthesis uses sun light to make ATP and NADPH through the electron transport chain, which moves from PS II to PS I, in the thylakoid membranes. Later, the Calvin cycle driven via ATP/NADPH can incorporate CO ₂ into glucose and other sugars (Ho <i>et al.</i> , 2010; Iverson, 2006)	149
Figure 4.1.2.2	General scheme representing the strategy used by four different carbon dioxide fixation pathways. The vertical arrows point to the carbon dioxide fixation products released from these metabolic cycles. The combination of the metabolic modules 1 and 4 results in the 3-hydroxypropionate cycle, as studied in <i>Chloroflexus</i> sp. The combination of 1 and 3 yields the 3-hydroxypropionate/4-hydroxybutyrate cycle present in several Crenarchaeae. The combination of 2 and 3 yields the dicarboxylate/4-hydroxybutyrate cycle proposed to be present in <i>Ignicoccus</i> . The combination of 2 and 5 yields the reductive citric acid cycle, which is present in various anaerobes or microaerobes.	150

SCHEMES

Scheme 3.3.1	Bifunctional synergistic catalysts having acid and base sites.	110
Scheme 3.3.2	Biphasic system, composed of scCO ₂ and ILs, for the carboxylation of oxiranes (Kanawami H. <i>et al.</i> , 2003).	111
Scheme 3.3.3	Resolution of racemic oxiranes.....	112
Scheme 3.3.4	Direct route to cyclic carbonates from an olefin and CO ₂ , in water (Egbhali N. and Li C.J., 2007).....	113
Scheme 3.4.1	Formation of a linear supramolecular polymer <i>via</i> self-assembly of calixarene capsules and reaction with CO ₂ (Rudkevich D. M. <i>et al.</i> , 2005).....	116
Scheme 3.4.2	Separation of a target molecule from a solution, employing CO ₂ (Zhang H. <i>et al.</i> , 2007, Stastny V. <i>et al.</i> , 2007).....	116
Scheme 3.4.3	An example of CO ₂ as an assembly agent for constructing lamellar materials with high amounts of amine functionality (Alauzun J. <i>et al.</i> , 2005).....	117
Scheme 3.4.4	Poly(urethane-amine) obtained by copolymerization of 2-methylaziridine and carbon dioxide under supercritical conditions.....	118

Scheme 3.5.1 Reaction of propylene oxide and CO ₂ to form polypropylene carbonate (PPC).....	124
Scheme 4.2.3.1 Calera mineralisation via aqueous precipitation (MAP)	213
Scheme 4.2.3.2 Process flow of the CALERA Moss Landing pilot plant	214
Scheme 4.2.3.3 New Sky's process operations	216
