

ADVANCED MATERIALS FOR CO₂ CAPTURE AND SEPARATION

A techno-economic investigation
commissioned by the members of the
Carbon Dioxide Capture & Conversion (CO₂CC) Program

Client Private
September 2022

The Carbon Dioxide Capture & Conversion (CO₂CC) Program

The **CO₂CC Program** is a membership-directed consortium whose members are involved in the development, monitoring and utilization of the “state-of-the-art” in technological progress and commercial implementation of carbon dioxide capture/clean-up and conversion. By the direction of the member companies (through balloting and other interactive means), the program delivers a range of timely and insightful information and analyses which are accessible exclusively to members and protected by confidentiality agreements. The objective is to document technically and commercially viable options for CO₂ capture/clean-up as well as its conversion into useful products which meaningfully address the challenges posed by CO₂ life-cycle and overall sustainability issues.

Members receive three in-depth **CO₂CC Techno-economic Reports** which are written by leading scientists and experienced industry professionals in areas selected by the membership (via ballot); weekly *CO₂CC Communiqués* (delivered via e-mail) which provide the latest updates on technical breakthroughs, commercial events and exclusive development opportunities; and attendance at the CO₂CC Program **Annual Meeting**.

The **Carbon Dioxide Capture & Conversion (CO₂CC) Program** is available on a membership basis from The Catalyst Group Resources (TCGR). For further details, please contact Chris Dziedziak at cdziedziak@catalystgrp.com or +1.215.628.4447.

EXECUTIVE SUMMARY	xxiii
1. INTRODUCTION	1
1.1 BACKGROUND.....	1
1.2 SCOPE AND OBJECTIVES	2
1.3 AUTHORS AND CONTRIBUTORS.....	3
1.4 REFERENCES	4
2. MATERIALS FOR POST-COMBUSTION AND PRE-COMBUSTION CO₂ CAPTURE	7
2.1 INTRODUCTION.....	7
2.2 POST-COMBUSTION CO ₂ ABSORPTION	7
2.2.1 Different Alkaline Solutions	7
2.2.2 Influence of Additives on CO ₂ Absorption.....	11
2.2.3 Influence of Reaction Parameters.....	13
2.2.4 Reactor for CO ₂ Absorption.....	17
2.3 PRE-COMBUSTION CO ₂ CAPTURE.....	23
2.3.1 Syngas Production.....	23
2.3.2 Water Gas Shift Reaction for H ₂ Production.....	26
2.3.3 Sorption Enhanced H ₂ Production.....	28
2.4 ECONOMIC ANALYSIS.....	30
2.4.1 Absorption-based Post-combustion CO ₂ Capture (PCC).....	31
2.4.2 Economic Analysis of Pre-combustion CO ₂ Capture.....	35
2.5 ASSESSMENT AND HURDLES	37
2.6 SUMMARY AND CONCLUSIONS.....	38
2.7 REFERENCES	39
3. MATERIALS FOR CO₂ CAPTURE BY ADSORPTION METHODS	51
3.1 INTRODUCTION.....	51
3.2 ADSORPTION WITH MESOPOROUS MATERIALS	51
3.2.1 SiO ₂ Based Mesoporous Materials.....	51
3.2.2 Carbon Based Mesoporous Materials.....	52
3.2.3 Alumina Based Mesoporous Materials	53
3.2.4 Other Mesoporous Materials.....	54

3.3	ADSORPTION WITH MgO-BASED MATERIALS	55
3.3.1	MgO Development	55
3.3.2	Influence of Process Parameters	57
3.4	ADSORPTION WITH CaO-BASED MATERIALS	59
3.4.1	CaO Synthesis.....	59
3.4.2	Influence of Process Parameters	60
3.4.3	Reaction Mechanism	61
3.5	ADSORPTION WITH BIOCHAR-BASED MATERIALS	62
3.5.1	Biochar Preparation from Biomass Pyrolysis.....	62
3.5.2	Influence of Process Parameters	64
3.6	ADSORPTION WITH MOF-BASED MATERIALS.....	65
3.6.1	Type of MOF Materials for CO ₂ Capture.....	65
3.6.2	Modification of MOF for CO ₂ Capture	66
3.6.3	Influence of Process Parameters	68
3.7	ECONOMIC ANALYSIS	69
3.7.1	Cost of Solid Sorbents	69
3.7.2	Capital Cost of CO ₂ Capture and Adsorption.....	70
3.7.3	Whole System Economic Analysis.....	73
3.7.4	Sensitivity Analysis of CO ₂ Adsorption	75
3.8	ASSESSMENT AND HURDLES.....	75
3.9	SUMMARY AND CONCLUSIONS	77

Figure 3.11	Capital cost estimation using the bottom-up approach	71
Figure 3.12	Breakdown of the contributions of the various components to the capital cost	72
Figure 4.1	Effects of temperature on the predicted upper bounds for (a) CO ₂ /N ₂ , (b) CO ₂ /CH ₄ , (c) H ₂ /CO ₂ , and (d) CO ₂ /H ₂	93
Figure 4.2	Schematic of gas permeation through a facilitated transport membrane	95
Figure 4.3	Synthesis route of poly(1,3-dioxolane) at 70°C	97
Figure 4.4	Structures of commercial fluorinated polymers and perfluorodioxolane polymers	98
Figure 4.5	Thermally rearrangement mechanism of (a) TR- α and (b) TR- β	100
Figure 4.6	Synthesis of a TR-PBO copolymer containing Tröger's base units	102
Figure 4.7	Synthesis of 6FDA-iptycene polyimides by using (a) triptycene and extended triptycene and (b) pentiptycene	103
Figure 4.8	Hydroxyl-functionalized polyimides, derived from 2,2-bis(3-amino-4- hydroxyphenyl)-hexafluoropropane (APAF), containing conventional 6FDA and PIM-type 9,10-diisopropyl-triptycene dianhydrides (TPDA)	104
Figure 4.9	Synthesis scheme of the cross-linked tris(2-aminoethyl) amine-poly(ethylene glycol) diacrylate membrane	106
Figure 4.10	Simplified mechanism of oxidation and cross-linking of PDMS by oxygen plasma	109
Figure 4.11	(a) Stepwise reductive amination of PVAm and (b) the transport performances of the modified PVAm with 27 and 36% methylation degrees, respectively, against the upper bounds	112

Figure 4.12	IP of FTM containing rigid contortion units of spirobisindane and tertiary amino groups.....	113
Figure 4.13	The carbamate pathways of (a) PZ-Gly and (b) PZEA-Sar and the bicarbonate pathways of (c) PZ-Gly and (d) PZEA-Sar for leading to their preferred products. Relative energies (ΔE , with respect to reactants) of structures in the amine-CO ₂ reactions of carriers following the (e) carbamate and (f) bicarbonate pathways	114
Figure 4.14	(a) ¹ H NMR spectra of 0.5 m tetramethylammonium fluoride (TMAF) before and after heating at 130°C; (b) chemical shifts of water in the presence of 0.5 m of KF, CsF, and TMAF	116
Figure 4.15	(a) Polymer support casting machine; (b) thin-film coating machine; (c) PES casting solution for support fabrication; (d) amine-containing coating solution; (e) 14"-wide scale-up PES substrate (insert: SEM of the PES surface morphology); (f) 14"-wide scale-up composite membrane (insert: cross-sectional SEM of the composite membrane's top layer); (g) photo of OSU's 1.4-m ² SW module at NCCC; (h) 500-h stability of the SW module	121
Figure 4.16	(a) CO ₂ purity map at different membrane areas and permeate-to-feed pressure ratios of a single-stage membrane process with a CO ₂ /N ₂ selectivity of 50; (b) attainable CO ₂ recovery and purity for a single-stage membrane process with CO ₂ /N ₂ selectivities of 20–60.....	122
Figure 4.17	Two-stage membrane processes: (E1)–(E5) enriching cascades; (S1)–(S5) stripping cascades. Keys: ◻ = compressor; ◻ = expander; ◯ = vacuum pump. Stream: warmer color (e.g., red) = higher CO ₂ concentration; colder color (e.g., blue) = lower CO ₂ concentration. Warmest to coldest colors: red, orange, purple, blue.	124
Figure 4.18	Comparison of parasitic energy consumptions of process E4 in Figure 4.17 vs. MEA absorption for CO ₂ recoveries of 50, 70, and 90%. A CO ₂ permeance of 185 GPU and a CO ₂ /N ₂ selectivity of 43 were used for the membrane.....	125
Figure 4.19	Membrane properties required for process E4 in Figure 4.17 to be cost-competitive vs. MEA absorption	126
Figure 4.20	(a) Flow diagram of two-stage retentate recycle process to capture CO ₂ from coal-fired power plant; (b) changes of CO ₂ partial pressure and the corresponding CO ₂ permeances in a FTM module with 30, 70, and 90% CO ₂ recoveries.....	127
Figure 4.21	(a) Flow diagram of a two-step air sweep membrane process to capture and sequester CO ₂ from coal-fired power plant; (b) effect of CO ₂ /N ₂ selectivity on capture cost for 90% CO ₂ capture. Base case = 1000 GPU and 50 CO ₂ /N ₂ selectivity.....	128

Figure 4.22	Effects of CO ₂ mole fraction on the membrane, rotary equipment, maintenance, and energy costs for process S2 in Figure 4.17.....	129
Figure 4.23	(a) Single-stage membrane process using a H ₂ -selective membrane; (b) H ₂ -selective membrane process using compressed N ₂ from the ASU as sweep gas	130
Figure 4.24	(a) CO ₂ -selective membrane process assisted by cryogenic distillation for 90% carbon capture from IGCC plant; (b) effect of CO ₂ /H ₂ selectivity on power consumption	131
Figure 4.25	CAPEX, OPEX, and energy contributions to the levelized cost of electricity (LCOE) of IGCC power plants with different carbon capture technologies.....	132
Figure 4.26	Transport properties of selected polymers against the (a) 2008 and 2019 CO ₂ /N ₂ upper bounds, (b) theoretical CO ₂ /H ₂ upper bounds at 25 and 120°C, (c) 2008 H ₂ /CO ₂ upper bound and its theoretical projection at 150°C, and (d) 2008 and 2019 CO ₂ /CH ₄ upper bounds	133
Figure 5.1	Influence of spark timing on BSFC and θ_F	161
Figure 5.2	Simplified illustration of a chemical looping process.....	162
Figure 5.3	Schematic diagram of sorption enhanced chemical looping reforming of methanol.....	163
